Project Idea

Recruitment Platform

1. Three user roles

Administrator: registers HR and interviewer accounts, changes roles and account status, and can also manage candidates, jobs, and applications.

HR: keeps candidate profiles and job openings, moves applications through hiring stages, and assigns interviewers.

Interviewer: sees only assigned applications and submits evaluations.

2. Competing quality attributes

Availability vs. consistency: each service stores its own data and can keep running if another service is down, so a change that touches a candidate, a user, and an application is not always one immediate update.

Performance vs. modifiability: each service can be changed on its own, but a hiring step that needs a user, a candidate, and an application has to call more than one service, so it takes longer than it would in a single application.

3. External system

LDAP as an identity provider, so company accounts can be authenticated outside the application's own user directory.

4. Separated Services

An authentication service, a candidate service, an application and hiring-pipeline service, and a separate web frontend. Each service can be deployed on its own.

5. Scope

Candidates, jobs, applications, stage changes, interviewer assignments, and evaluations.
